1.Introduction

The Job Finding System (Job Portal) is a modern digital platform that connects job seekers with potential employers. It replaces traditional, time-consuming hiring methods with an automated and efficient approach. Acting as a centralized hub, the system integrates key employment processes such as candidate profiling, job postings, and job requests. By matching skills with job requirements, enabling smooth communication, and providing real-time updates, it enhances the overall success of the employment process for both job seekers and organizations.

For job seekers, the system offers a reliable way to discover opportunities, present qualifications, and track career progress. Employers and recruitment agencies benefit from a wider talent pool, streamlined applicant screening, and easy vacancy management. Administrators can also use the system to maintain accurate job records, ensure compliance with employment standards, and generate useful data for market analysis.

The idea for this system comes from challenges in traditional job markets, such as lack of information, long hiring cycles, and limited visibility for qualified candidates. To solve these issues, the system is developed with clear objectives, well-defined requirements, and strong data and process models. The development includes designing an intuitive user interface, creating secure databases, and ensuring reliability through coding, testing, and documentation. Overall, the project aims to reduce inefficiencies, strengthen connections between job seekers and employers, and empower individuals and organizations to achieve their professional goals

2.problem of statement

The current job search and recruitment process is inefficient and fragmented, causing challenges for both job seekers and employers/Companies. Job seekers struggle with browsing multiple platforms, spending hours applying without responses, and finding positions that match their skills, while employers/Companies face high costs, overwhelming numbers of unqualified applications, and difficulty identifying suitable candidates quickly. The lack of a centralized platform creates delays, stress, and missed opportunities on both sides. A Job Finding System aims to address these issues by using modern technology, automation, and a unified platform to streamline communication, improve matching accuracy, and make the hiring process more efficient and effective for all parties.

3.Objectives

Some of the objectives in order to build the Job Finding System are as follows:

- To create a centralized platform where all job listings are available in one place.
- To provide smart job matching so users only see jobs relevant to their skills and qualifications.
- To simplify and speed up the hiring process for companies to post jobs and find suitable candidates.

4.Methodology

4.1.Requirements Analysis

4.1.1.Study of Existing System

Several job portals currently operate in Nepal, including MeroJob, JobsNepal, LinkedIn, and Kumari Job. These platforms provide valuable services such as online job listings, candidate profiling, and recruitment support, primarily catering to formal, urban-based employment. For instance, Kumari Job, managed by First Job Nepal Pvt. Ltd., is one of the country's leading platforms, offering vacancies across multiple sectors such as IT, engineering, finance, education, and hospitality. Employers can post jobs, manage applications, and access HR outsourcing services, while job seekers can create profiles, upload resumes, and apply through both web and mobile applications [1].

Despite their popularity, these platforms face several limitations. They are mainly effective in urban areas and less accessible for rural populations, where people often rely on word-of-mouth, newspapers, or social media to find work [2]. Users also report issues such as low engagement from employers, lack of feedback after applications, fake or outdated job listings, and technical challenges like poor mobile optimization, slow loading speeds, and unpolished interfaces. These problems reduce trust in existing portals and highlight the gap in connecting job seekers with reliable opportunities across the country.

4.1.2.Requirement Collection

4.1.2.1.Functional Requirements

Fig: Use case Diagram of Job Finding System(Job Portal)

The **Job Finding System** is designed to connect **Job Seekers, Employers/Companies, and Admins** within a single platform. The use case diagram outlines how these three actors interact with the system's core functions, ensuring a smooth and centralized process for job searching, hiring, and system management.

- **Job Seekers** can register, log in, create profiles, search for jobs, and apply directly through the platform.
- **Employers/Companies** can register, log in, post job vacancies, and review or accept applications efficiently.
- **Admins** oversee the system, verify company profiles, manage job categories, generate reports, and maintain the platform's reliability.

This centralized model addresses existing issues such as scattered job postings, lack of trust, and limited rural access. It provides a **time-saving, reliable, and user-friendly** solution for all parties involved.

Actor Descriptions

1. Job Seeker (Employee)

Job seekers use the system to register and securely log in or out, create and manage their personal profiles, search job postings across various categories, and apply for jobs while tracking their application status. The platform simplifies the job search process by consolidating opportunities into one reliable and accessible system.

2. Employer (Company)

Employers use the system to register their organization and manage its profile, post or update job vacancies, and remove listings when necessary. They can view applications in an organized manner and shortlist or accept candidates for positions. By centralizing recruitment, the system allows employers to access a wider pool of candidates and make faster, more efficient hiring decisions.

3. Admin

The Admin plays a vital role in ensuring the smooth operation of the Job Portal Management System. They manage user accounts for both job seekers and employers, verify company profiles and job postings to maintain credibility, and organize job categories for easier searching. Additionally, the Admin monitors system activities, generates reports, performs maintenance, and ensures security against potential threats. Overall, the Admin acts as the backbone of the system, maintaining its efficiency, integrity, and reliability for all users.

4.2. Feasibility Study

The feasibility analysis indicates that the Job Finding System project is viable in terms of time and cost. The use of open-source tools and frameworks ensures minimal development and maintenance expenses.

4.2.1. Technical Feasibility

The system is designed to run on widely available hardware and software, ensuring easy implementation and scalability. It can be upgraded to support future improvements and handle increased user demand. Development relies on **standard web technologies**—HTML, CSS, JavaScript, PHP, and MySQL—using XAMPP or similar local servers for deployment. Since all these tools are open-source and cross-platform, the system guarantees **high compatibility, flexibility, and maintainability**, making it suitable for long-term use and continuous improvement.

4.2.2. Operational Feasibility

The Job Finding System emphasizes **simplicity and user-friendliness**. It integrates smoothly into existing hiring practices while being intuitive for job seekers to navigate. No extensive training is required for operation. The interface is designed to be responsive, fast, and easy to use, ensuring a seamless experience for both recruiters and job seekers. By reducing manual effort, saving time, and improving efficiency in job posting, searching, and application management, the system provides clear operational benefits.

4.2.3. Economic Feasibility

The system is highly **cost-effective** due to its reliance on open-source tools and affordable web hosting solutions. The long-term benefits—such as reduced recruitment expenses, faster hiring cycles, and broader access to qualified candidates—significantly outweigh the minimal development and maintenance costs. For both job seekers and employers, the system delivers substantial value by streamlining the employment process and improving overall organizational efficiency [4].

4.3. High Level System Design (System Flowchart)

The structure and process of the Job Finding System are illustrated in the following flowchart

Figure 1: Process Workflow Chart of the Job Finding System(Job Portal)

The flowchart begins at the Start point, introducing the Job Finding System, which provides three distinct user roles: Administrator, Company, and Job Seeker. Each of these roles follows a structured workflow designed to streamline tasks while maintaining efficiency and simplicity across the system.

For administrators, the process begins with login authentication. If the entered credentials are invalid, they are prompted to try again until successful verification. Once logged in, administrators can perform core management functions such as handling company accounts, overseeing employee records, adding and maintaining job categories, and ensuring overall system maintenance. These responsibilities allow administrators to preserve the integrity, security, and smooth operation of the system. After completing their activities, administrators log out, which directs them to the end of their workflow.

Companies, on the other hand, begin by either registering as new users or logging in with existing credentials. Once successfully authenticated, they gain access to features that support their recruitment activities. They can post job vacancies, receive and review applications from job seekers, update and maintain job reports, and manage their company profiles to ensure accurate information. Additionally, they can establish communication with applicants or system administrators through the contact feature. This workflow equips companies with efficient tools to organize and streamline their hiring process from start to finish.

Job seekers also follow a similar process of either registering for a new account or logging in to the system. Once authenticated, they can search for available jobs, apply for relevant positions, and manage or update their profiles to reflect their skills and qualifications. They also have the option to check job status updates and remain informed about opportunities, while maintaining direct communication with employers or the system administrators whenever needed. By following this workflow, job seekers are provided with a smooth and accessible platform for career exploration and application management.

In conclusion, the flowchart clearly demonstrates the structured and role-based processes of the Job Portal Management System. It highlights how administrators, companies, and job seekers interact within the system, ensuring a balanced, user-friendly, and efficient environment for managing recruitment and career opportunities.

5.Gantt Chart

Title	Start Date	End Date	Duration(Days)
Planning	8/15/2025	8/29/2025	14
Analysis	8/30/2025	9/19/2025	21
Design	9/20/2025	10/10/2025	21
Coding	9/20/2025	11/14/2025	56
Testing	10/11/2025	11/11/2025	35
Documentation	8/15/2025	12/5/2025	112

This Gantt chart represents the timeline for developing the Job Finding System from August to December, broken down into different project phases. The work starts in August with the Planning phase, which lasts for two weeks and focuses on defining goals, requirements, and strategies for building the system. In September, the project moves into the Analysis phase, where the team studies system requirements, user needs, and technical specifications over the next three weeks.

By October, the focus shifts to Design, where the structure, layout, and user interface of the system are created over a four-week period. At the same time, Coding also begins in late October and continues through November and December to implement the features and functionalities of the system.

Meanwhile, Testing starts in November alongside coding to ensure that errors are identified and fixed early. Documentation runs throughout the entire project, beginning in August and

continuing until December, to keep track of development progress, system details, and user manuals.

Overall, this Gantt chart clearly shows how different project phases overlap and run sequentially, helping the development team stay organized, meet deadlines, and deliver a fully functional Job Finding System by the end of December.

6.Expected Outcomes

Upon completion of the project, the process of finding and applying for jobs becomes much easier for both job seekers and employers. Individuals can use a phone or computer to search for available jobs, submit applications, and track their status in a single platform. Employers\Company can quickly post job openings, review applications, and find candidates that best match their requirements. The system ensures that information about available positions, required qualifications, and application deadlines is clear and easily accessible. By streamlining the job search and hiring process, the system encourages more efficient employment connections and helps reduce the time and effort involved in finding suitable opportunities. Overall, the project makes the entire job market more convenient, transparent, and connected, benefiting both job seekers and employers.
